

Getting Your Yard Ready

3 simple steps for the best possible results

Thanks for booking with Island Hydroseeding. We provide hydroseed application only, which means how your lawn turns out depends heavily on how the ground is prepped before we arrive. These three things matter most:

1

Topsoil Depth

Have a **minimum of 4 inches** of quality topsoil across the whole area for best results. That's what gives new grass room to root and grow strong, especially in our region's heavier clay soil.

2

Roll to Firm, Even Ground

Run a lawn roller over the area so the soil is **firm and level**, giving seed the solid contact it needs. Aim for firm underfoot, not hard as pavement. Too loose or too compacted both make it harder for grass to establish.

3

Water Before We Arrive

Give the area a deep watering **right before your appointment** so the ground is moist, not dry. Hydroseed bonds and germinates best on damp soil.

Also make sure:

- ✓ Area is clear of debris, rocks, and old grass, with access for our equipment
- ✓ Vehicles, furniture, and pets are out of the work area during application
- ✓ Anything movable you don't want overspray on, like patio furniture, planters, or toys, is out of range

Before: Prepped & Rolled

During: Freshly Applied

After: Grown In

Please note: because we provide application only and do not grade, till, or amend soil, proper prep as outlined above gives your new lawn the best chance to succeed. Even with everything prepped correctly, germination and final results also depend on weather, watering, and care after we leave, so we're not able to guarantee specific outcomes. Questions about what your property needs? Reach out before your appointment.
